RHYTHM IN THE WEATHER For 1962 and 1963. We were wrong in all of Forecast Early Winter Coming In with a Roar

BY ROBERT HERGUTH

Chicago is in for an early winter—starting with a roar about Nov. 4.

It will be stormy for a day or two, with high winds and rain.

Then it will turn sharply colder.

This prediction came from Harry Geise, 39, a sunny weather genius who dropped by the Daily News to forecast the whole winter.

Geise, who grew up in Oak Park, was in town Thursday representing Irving P. Krick of Denver.

HARRY GEISE

Krick operates the world's oldest (about 28 years) and largest private weather forecasting service.

"Krick and the men around him have discovered weather doesn't happen just by chance," said Geise.

"They have found that God has created a rhythm to the weather, though it's a complicated one."

...

KRICK'S group has been able to capture this rhythm and forecast weather years

ahead, said Geise, with the combined aid of:

- A new, complex mathematical formula.
- Performance charts of weather between 1935 and 1955.
- Computing machines that do the work of 50,000 persons.
- Charts showing high and low pressure areas above the earth.

...

ALL THESE add up to the following winter for Chicago, says Geise:

November—Winter weather starting about Nov. 4. Storminess a day or two around the 13th and 18th-19th. Milder weather most of the last seven days.

December — "Not too impressive," not colder than nor-

mal, showers or rain around the 23d, turning somewhat colder just before Christmas.

January—Storminess about the 8th, accompanied by strong winds. This storm will develop into glazing or freezing rain. Cold snaps about the 13th, the 18th or 19th, the 28th or 29th. Another storm around the 24th.

February — A storm predicted about the 1st followed by colder weather. Snow forecast for a couple of bad days between the 7th and 11th. Colder about the 10th-11th and on the 15th. Storminess with strong winds about the 23d.

March — Storminess around the 2d or 3d, and around the 23d or 24th.

April — Storminess around the 2d and 7th, both followed by colder weather. The storm of the 2d could produce tornadoes in Kansas, Missouri or Oklahoma.
